

Current situation is a Jungle (RIGA conference):

- No Digital Single Market for e-skills
- No clear curricula for IT Professionalism
- Mismatch in existing and required e-skills
- ICT training programs & certificates are difficult/impossible to compare (learning outcomes, quality, what is really required?)
- It is a well known problem for stakeholders
- BUT: still nothing happens
- This is greatly hampering the Digital Single Market

What themes to address urgently ?

- Start mapping existing ICT education to e-CF/ICT profiles; revise existing certificates accordingly; make European certificates (not national)
- Involve ICT professionals in further developing ICT profiles (security managers, architects, etc.) and revision of existing programs
- Create user (market) - suppliers (education) interactions in improvement programs
- Start European accreditation and quality systems
- Start European register for European ICT professionals (security, architects, etc.)

What is soonest needed ?

- The stakeholders should soonest agree this needs to be solved; commitment to act
- Stakeholders to agree on a “minimum” European Governance to solve the issues
- That Governance should be composed of a Board (representing major stakeholders) and a (small) executing organization
- A plan should be made and agreed upon
- A minimal funding and capacity is urgently needed
